Those who decorate and produce cans know that the impact extruded production of cans is limited regarding speed to 180 cans per minute or 40 million cans per year. Global markets require faster response capabilities. With the new HINTERKOPF technology, the production speed goes up to 400 cans per minute or over 120 million cans per year and per production line.

The magic word is continuous motion. The heart of such trend-setting production is the Transfer System C400. It opens new perspectives and ways of cooperation between the can maker and the marketer, allowing the latter one single source from dedicated plants.

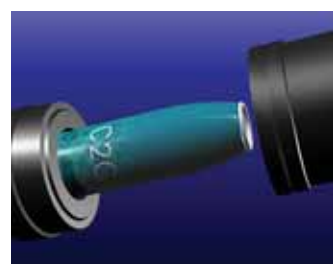

To achieve this goal, HINTERKOPF, the leading machine manufacturer offers the new C2C Coil to Can Technology.
